## **DISCO DUO - Capstone Project**

Student name: Vi Bui Student pace: Part-Time

• Scheduled project review date/time: Mon. 05/02/22

· Instructor name: Claude Fried

• Blog post URL: https://datasciish.com/ (https://datasciish.com/)

## 1.1 Overview

**Client:** Existing or new music streaming services. Existing: Spotify, Pandora, Amazon Music, etc. New: companies interested in building new platforms to connect people through music.

**Objective:** Create a platform where listeners of the same song are connected and able to discover new songs through their "connector song" by requesting another song based on a musical metric such as: danceability, loudness, acousticness, valence, etc.

#### Data, Methodology, and Models

Data source: Spotify

- Spotify Song Data <a href="https://www.kaggle.com/akiboy96/spotify-dataset">https://www.kaggle.com/akiboy96/spotify-dataset</a>
   (https://www.kaggle.com/akiboy96/spotify-dataset)
- 2. Spotify Genre Data <a href="https://www.kaggle.com/code/akiboy96/spotify-song-popularity-genre-exploration/data?select=genre-music.csv">https://www.kaggle.com/code/akiboy96/spotify-genre-exploration/data?select=genre-music.csv</a> (<a href="https://www.kaggle.com/code/akiboy96/spotify-song-popularity-genre-exploration/data?select=genre-music.csv">https://www.kaggle.com/code/akiboy96/spotify-song-popularity-genre-exploration/data?select=genre-music.csv</a>)

**Methodology:** Pull sample from data; create spectrogram images for songs; train model to predict danceability

**Models:** Sequential Models

- 1. Layers
- 2. Stochastic
- 3. Add layers

## 2 Data Exploration, Cleansing, and Visualization

## **Data Exploration**

**Explore Spotify dataset** 

#### **Data Cleansing**

Check for duplicates; drop duplicate and NaN (missing) values; continuously clean data as necessary

## **Data Visualization**

Use visualizations to explore the data and determine how to further refine the dataset in order to prepare for modeling

## **Data Preparation**

Prepare the data for modeling

## 2.1 Data Exploration and Cleansing

Import data and all packages needed for data exploration and modeling

```
In [1]: import pandas as pd
        import numpy as np
        import matplotlib.pyplot as plt
        %matplotlib inline
        import seaborn as sns
        import pydub
        from pydub import AudioSegment
        import librosa
        import librosa.display
        import tensorflow as tf
        import tensorflow io as tfio
        from tensorflow.keras import layers, models
        from tensorflow.keras.callbacks import EarlyStopping
        from keras.models import Sequential
        # Import from keras preprocessing not from keras.preprocessing
        from keras_preprocessing.image import ImageDataGenerator
        from keras.layers import Dense, Activation, Flatten, Dropout, BatchNormaliz
        from keras.layers import Conv2D, MaxPooling2D
        from keras import regularizers, optimizers
        from sklearn.model selection import train test split
        from sklearn.preprocessing import OneHotEncoder
        import os
        import warnings
        executed in 3.29s, finished 04:15:45 2022-04-25
```

```
In [2]: # Import song data
```

songs = pd.read\_csv('spotify\_data.csv',index\_col=0)

executed in 113ms, finished 04:15:45 2022-04-25

## In [3]: # View song dataframe

songs.head()

executed in 18ms, finished 04:15:45 2022-04-25

2.1.1 Feature Description Definitions

There are 58,472 rows in the merged dataframe

## **Features**

**Source:** <a href="https://developer.spotify.com/documentation/web-api/reference/#/operations/get-audio-features">https://developer.spotify.com/documentation/web-api/reference/#/operations/get-audio-features</a>)

\*\*\* used for current model

single asterisk - will be used for future models

## 1. danceability \*\*\*

A value of 0.0 is least danceable and 1.0 is most danceable. Danceability describes how suitable a track is for dancing based on a combination of musical elements including tempo, rhythm stability, beat strength, and overall regularity.

## 2. energy \*

Energy is a measure from 0.0 to 1.0 and represents a perceptual measure of intensity and activity. Typically, energetic tracks feel fast, loud, and noisy. For example, death metal has high

energy, while a Bach prelude scores low on the scale. Perceptual features contributing to this attribute include dynamic range, perceived loudness, timbre, onset rate, and general entropy.

## 3. **key**

The key the track is in. Integers map to pitches using standard Pitch Class notation. E.g. 0 = C, 1 = C #/D #, 2 = D, and so on. If no key was detected, the value is -1. (>= -1, <= 11).

#### 4. loudness

Values typically range between -60 and 0 db. The overall loudness of a track in decibels (dB). Loudness values are averaged across the entire track and are useful for comparing relative loudness of tracks. Loudness is the quality of a sound that is the primary psychological correlate of physical strength (amplitude).

#### 5. **mode**

Major is represented by 1 and minor is 0. Mode indicates the modality (major or minor) of a track, the type of scale from which its melodic content is derived.

#### 6. speechiness \*

Speechiness detects the presence of spoken words in a track. The more exclusively speech-like the recording (e.g. talk show, audio book, poetry), the closer to 1.0 the attribute value. Values above 0.66 describe tracks that are probably made entirely of spoken words. Values between 0.33 and 0.66 describe tracks that may contain both music and speech, either in sections or layered, including such cases as rap music. Values below 0.33 most likely represent music and other non-speech-like tracks.

#### 7. acousticness \*

A confidence measure from 0.0 to 1.0 of whether the track is acoustic. 1.0 represents high confidence the track is acoustic. (>= 0, <= 1).

#### 8. instrumentalness \*

Predicts whether a track contains no vocals. "Ooh" and "aah" sounds are treated as instrumental in this context. Rap or spoken word tracks are clearly "vocal". The closer the instrumentalness value is to 1.0, the greater likelihood the track contains no vocal content. Values above 0.5 are intended to represent instrumental tracks, but confidence is higher as the value approaches 1.0.

#### 9. liveness \*

Detects the presence of an audience in the recording. Higher liveness values represent an increased probability that the track was performed live. A value above 0.8 provides strong likelihood that the track is live.

## 10. valence \*

A measure from 0.0 to 1.0 describing the musical positiveness conveyed by a track. Tracks with high valence sound more positive (e.g. happy, cheerful, euphoric), while tracks with low valence sound more negative (e.g. sad, depressed, angry).(>= 0, <= 1)

#### 11. tempo

The overall estimated tempo of a track in beats per minute (BPM). In musical terminology, tempo is the speed or pace of a given piece and derives directly from the average beat

duration.

## 12. duration\_ms

The duration of the track in milliseconds.

## 13. time\_signature

An estimated time signature. The time signature (meter) is a notational convention to specify how many beats are in each bar (or measure). The time signature ranges from 3 to 7 indicating time signatures of "3/4", to "7/4". (>= 3, <= 7).

#### 14. **id**

The Spotify ID for the track.

#### 15. **uri**

The Spotify URI for the track.

4.3.0.1 Result: Model 3 performed better than Model 2, but not as well as Model 1 - loss: 0.0287 - val loss: 0.0259

#### # Evaluation and Conclusions

- \* All three Sequential Models performed well, and we feel most confident with Model 3

  \* With Model 3's RMSE (root mean squared error) = loss: 0.0214 val lose
- \* With Model 3's RMSE (root mean squared error) = loss: 0.0214 val\_loss: 0.0183, our model shows it will be a strong predictor of "danceability" of songs
- \* We will use the same approach in our Future Work with other metrics in the dataset

#### 5 Evaluation and Conclusions

- All three Sequential Models performed well, and we feel most confident with Model 3
- With Model 3's RMSE (root mean squared error) = loss: 0.0214 val\_loss: 0.0183, our model shows it will be a strong predictor of "danceability" of songs
- We will use the same approach in our Future Work with other metrics in the dataset

#### **# FUTURE WORK**

- \* Run models for all remaining metrics for Disco Duo
- \* Remaining metrics:
- 1. Energy
- 2. Speechiness
- 3. Acousticness
- 4. Instrumentalness

- 5. Liveness
- 6. Valence
- \* Build platform to connect users listening to the same song and apply Disco Duo

### **6 FUTURE WORK**

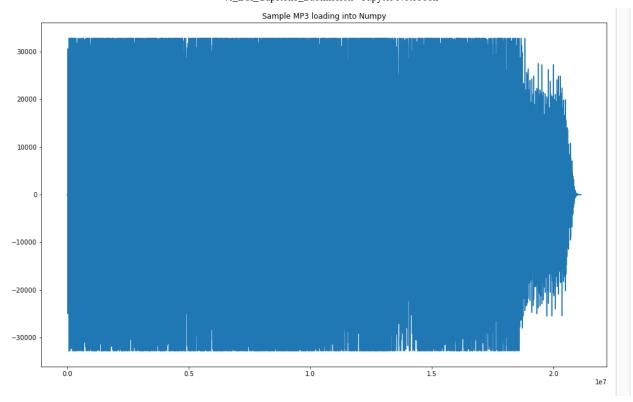

- · Run models for all remaining metrics for Disco Duo
- Remaining metrics:
- 1. Energy
- 2. Speechiness
- 3. Acousticness
- 4. Instrumentalness
- 5. Liveness
- 6. Valence
- Build platform to connect users listening to the same song and apply Disco Duo
